

Congratulations on your purchase of the sturdiest stand/stool that is on the market today! This stand will last you a lifetime and we are confident that you will be pleased with it.

A Very Important Note:

The first few times you assemble and disassemble the stand you can expect it to be tight and require greater-than-normal effort. We build these stands to exacting tolerances (which is why they are so solid). Over time, the assembly and disassembly process will become easier, while the fully-assembled stand will retain its rigidity.

Finishing Options:

The stand may be finished with stain or paint, or left plain. If it is finished, it will be slightly more difficult to assemble and disassemble.

Align the cross brace/seat assembly with the four slots in the rear part of the frame. It is very important that all four slots align properly. The four slots and their corresponding notches are circled in the photo at left.

Again, the first few assemblies will be somewhat stiff.

Once everything is aligned, push down firmly to fully seat the brace/seat assembly. The stand/stool will become rock solid.

Assembly Instructions:

Step 1:

Start by laying the two side pieces on the ground with the cross-piece between them.

Step 2:

Assemble each side piece by rotating it up into the cross piece notch.

The Fully Assembled Stand:

Disassembly Instructions:

Notice in the photo for Step 3 how the seat is hinged up in the front? This is very important for disassembly! To disassemble the stand/stool: firmly grasp the front and back edges of the seat and pull **up** on the front edge while pressing **down** on the rear. The lever action will allow the cross brace to be extracted from the slots.
